GTS123 Introduction to Computers and Programming

Lab 9: Problem 1

Write a Python program that receives a positive number and stores it in a variable x. (Note that a user will enter only a number – no string.) The program computes and shows the area of a circle whose radius equal to this nimber and the area of a square whose length equal to this number. The problem will use two functions as follows.

- A function called CirArea(x)computes the area of a circle whose radius is x.
- A function called SqArea(x)computes the area of a square whose length is x.

The output should look similar to the following.

```
Input a positive number: 5
The area of the circle is 78.54 square units.
The area of the square is 25.00 square units.
```

```
Input a positive number: 10.5
The area of the circle is 346.36 square units.
The area of the square is 110.25 square units.
```

```
Input a positive number: -5
Wrong Input
```

Note: To pass the test, your program must produce the exact output as shown above, including spaces and line breaks.
