GTS123 Introduction to Computers and Programming

Lab 9: Problem 2

Write a Python program that receives five inputs and store them in a list variable x. The program will ask a user to enter an integer number between 0 and 4 and store it in a variable n. The program will show Error! if the input is not an integer between 0 and 4. The program will use two functions to rotate the members in the list variable x to the left and the right.

The program shows these two lists. The output should look similar to the following.

- A function called LeftRotate() computes a list variable whose members in x are rotated to the left-hand side n times.
- A function called RightRotate() computes a list variable whose members in x are rotated to the right-hand side n times.

The output should look similar to the following.

```
Enter 5 inputs: a b c 1 2
Enter an integer number of rotations (0-4): 1
The left-rotated list: ['b','c','1','2','a']
The right-rotated list: ['2','a','b','c','1']
```

```
Enter 5 inputs: w x y z 5
Enter an integer number of rotations (0-4): 4
The left-rotated list: ['5','w','x','y','z']
The right-rotated list: ['x','y','z','5','w']
```

```
Enter 5 inputs: a b c 1 2
Enter an integer number of rotations (0-4): 6
Error!
```

```
Enter 5 inputs: w x y z 5
Enter an integer number of rotations (0-4): 2.5
Error!
```

Note: To pass the test, your program must produce the exact output as shown above, including spaces and line breaks.
