GTS123 Introduction to Computers and Programming

Lab 9: Problem 3

Write a Python program to repeatedly receive a nonnegative integer number from a user until the user enters the word "Done". The program shows the summation, the minimum, and maximum of these inputted numbers. The program will use four functions as follows.

- The program uses a function called UserInput() to repeatedly receive an input from a user until the user enters the word "Done". These inputs are stored in a list variable called xList.
- The program uses a function called SumOut() to compute the summation of the members in the list variable xList and show this summation on the screen.
- The program uses a function called MinOut() to find the minimum value of the members in the list variable xList and show this minimum on the screen.
- The program uses a function called MaxOut() to find the maximum value of the members in the list variable xList and show this maximum on the screen.

The output should look similar to the following.

```
Enter an input: 1
Enter an input: 2
Enter an input: 3
Enter an input: Done
The summation is 6
The minimum is 1
The maximum is 3
```

```
Enter an input: 7
Enter an input: 5
Enter an input: 3
Enter an input: 0
Enter an input: 1
Enter an input: Done
The summation is 16
The minimum is 0
The maximum is 7
```

```
Enter an input: 1
Enter an input: 2
Enter an input: -5
Error
```

```
Enter an input: 1
Enter an input: 2
Enter an input: 3
Enter an input: 4
Enter an input: 5.5
Error
```

```
Enter an input: 1
Enter an input: 2
Enter an input: abc
Error
```

Note: To pass the test, your program must produce the exact output as shown above, including spaces and line breaks.
