GTS123 Introduction to Computers and Programming

Lab 9: Problem 5

Write a Python program to ask a user to select a seat type and a movie type and show the ticket price according to the selections above. The ticket prices are shown in the table below.

Seat Type	**Digital (1)**	**3-D (2)**
Premium (P)	100	120
Deluxe (D)	140	200
Honeymoon seat (H)	400	500

The program will use the following three functions.

- The program uses a function called SeatType() to ask the user to select the seat type. If the user's selection is not P or D or H, the program will ask the user again.
- The program uses a function called MovieType() to ask the user to select the movie type. If the user's selection is not 1 or 2, the program will ask the user again.
- The program uses a function called TicketPrice() to show the ticket price according to the selected seat type and movie type.

The output should look similar to the following.

```
Select the seat type (P or D or H): D
Select the movie type (1 or 2): 2
The ticket price is 200
```

```
Select the seat type (P or D or H): H
Select the movie type (1 or 2): 1
The ticket price is 400
```

```
Select the seat type (P or D or H): A
Wrong seat type!  Please select again.
Select the seat type (P or D or H): B
Wrong seat type!  Please select again.
Select the seat type (P or D or H): P
Select the movie type (1 or 2): 1
The ticket price is 100
```

```
Select the seat type (P or D or H): H
Select the movie type (1 or 2): 4
Wrong movie type!  Please select again.
Select the movie type (1 or 2): 5
Wrong movie type!  Please select again.
Select the movie type (1 or 2): 2
The ticket price is 500
```

Note: To pass the test, your program must produce the exact output as shown above, including spaces and line breaks.
