GTS123 Introduction to Computers and Programming

Lab 9: Problem 6

Write a Python program that receives a temperature in degree Celsius. The program converts the degree Celsius unit (c) to Fahrenheit unit (f) by calling the function "CelsiusToFahrenheit(c)", where c is the input of this function. We have the following conversion:

$$f = (c \times 95) + 32.$$

The output should look similar to the following.

```
Input temperature in degree Celcius: 25
The degree in Farenheit is 77.00
```

```
Input temperature in degree Celcius: 39
The degree in Farenheit is 102.20
```

Note: To pass the test, your program must produce the exact output as shown above, including spaces and line breaks.
