GTS123 Introduction to Computers and Programming

Lab 9: Problem 7

Write a Python program that receives two values: height (h) and base (b). The program uses a function called "TriArea(h, b)" whose inputs are h and b to compute the triangle area:

$$\frac{1}{2} \times h \times b$$

The output of the program should look similar to the following.

```
Enter the height (h): 2
Enter the base (b): 4
The area of the triangle is 4.0
```

```
Enter the height (h): 15
Enter the base (b): 2
The area of the triangle is 15.0
```

```
Enter the height (h): 7.5
Enter the base (b): 3.2
The area of the triangle is 12.0
```

```
Enter the height (h): -2
Height and base must be non-negative.
```

```
Enter the height (h): 2
Enter the base (b): -5
Height and base must be non-negative.
```

Note: To pass the test, your program must produce the exact output as shown above, including spaces and line breaks.
