GTS123 Introduction to Computers and Programming

Lab 9: Problem 8

Write a Python program that receives three values: FirstVal, UpperBound, StepSize. The program uses a function called "myRange(FirstVal, UpperBound, StepSize)" whose inputs are FirstVal, UpperBound, and StepSize to do the same functionality as the built-in function range(FirstVal, UpperBound, StepSize). The output of the program should look similar to the following.

```
Enter the first number: 0
Enter the upper bound: 10
Enter the step: 2
Range = [0, 2, 4, 6, 8]
```

```
Enter the first number: 5
Enter the upper bound: 20
Enter the step: 4
Range = [5, 9, 13, 17]
```

```
Enter the first number: 9
Enter the upper bound: 8
Enter the step: 4
First number should be less than upper bound.
```

```
Enter the first number: 2.5
Please enter valid integers.
```

```
Enter the first number: 2
Enter the upper bound: 6.1
Please enter valid integers.
```

```
Enter the first number: 2
Enter the upper bound: 9
Enter the step: 0
Step size cannot be zero or negative.
```

Note: To pass the test, your program must produce the exact output as shown above, including spaces and line breaks.
