GTS123 Introduction to Computers and Programming

Lab 9: Problem 10

Write a Python program with two functions. The program asks a user to choose whether to compute the area of a square (s) or the area of a circle (c).

- If the user chooses to compute the area of a square, the program will ask the user to enter the length x, uses a function called "SquareArea(x)", and print out the corresponding area.
- If the user chooses to compute the area of a circle, the program will ask the user to enter the radius r, uses a function called"CircleArea(r)", and print out the corresponding area.
- If the user enters other inputs (not s or c), the program will print out Wrong Input.

The output of the program should look similar to the following

```
Do you want to find the area of a square (s) or a circle (c)?: s
Enter the length: 10
The area of the square is 100.00.
```

```
Do you want to find the area of a square (s) or a circle (c)?: c
Enter the length: 2
The area of the square is 12.57.
```

```
Do you want to find the area of a square (s) or a circle (c)?: a
Wrong Input
```

Note: To pass the test, your program must produce the exact output as shown above, including spaces and line breaks.
